

Make a difference – work where your contributions count

Collegiate Opportunities

Engineering

Healthcare providers are always seeking ways to make patient care safer and reduce recovery times following medical procedures. Many rely on Cardinal Health to provide custom-designed products that increase surgical safety and productivity. Through our engineering career opportunities, new graduates can contribute to our leading lines of products and gain extensive hands-on experience in the development of new medical devices that are improving the quality of patient care.

A presence in healthcare's most frequently performed procedures

Our career opportunities allow you to be mentored by and work side-by-side with Cardinal Health professionals. Our engineers improve processes, implement design enhancements to our existing medical/surgical devices and develop emerging medical products. These experiences and access to our resources help new graduates become well-rounded, results-driven leaders who are ready to make an impact on healthcare.

A limited number of rotational positions are available in our medical products businesses. During our three-year program, new graduates will:

- Design medical/surgical products in one of our manufacturing businesses by partnering with other product development engineers, regulatory affairs, marketing, quality assurance, outside suppliers and clinicians
- Improve processes and implement design enhancements by working closely with other research and development engineers
- Investigate new medical technologies to build technology assessment and research skills

Following successful completion of the program, employees may progress into a traditional full-time position based on their performance, interests, development and our business needs.

Cardinal Health employees are developing the market-leading technologies and medical/surgical devices that help reduce hospital-acquired infections and break the cycle of medication errors.

Who should apply

Cardinal Health primarily recruits graduates who meet the following minimum requirements:

- A degree in mechanical, biomedical, chemical or materials science or general engineering
- Excellent academic record; GPA of 3.5 or above on a 4.0 scale
- Relevant internship experience preferred
- Strong leadership, communication and analytical skills
- Demonstrated problem-solving skills and a solutions orientation
- Business acumen
- An appreciation for diversity
